Listing of Claims:

Claims 1-43 (cancelled)

RECEIVED
APR 30 2004
GROUP 3600

44. (Previously presented) A method comprising:

receiving a message in a receiver object from one of a plurality of feed lines;
attaching timing data from a timing object to the received message, the timing data
including a time extracted from the received message, a stamp indicating a receipt time at the
receiver object and other data;

activating a translator object to translate the received message into a market event object;
assigning the market event object to an entry in a queue object;
validating the market event object entry; and
publishing the validated market event object entry in a sender object to a plurality of alert
engines.

45. (Previously presented) The method of claim 44 in which the other data comprises a message
delta obtained by comparing the time extracted from the received message with times of
previously received messages from the one of the plurality of feed lines.

46. (Previously presented) The method of claim 44 in which assigning further comprises
registering a message sequence number in an associated sequence state object, the associated
sequence state object recording message order and gap data for the one of the plurality of feed
lines.

47. (Previously presented) The method of claim 46 in which validating comprises determining whether the market event object entry is valid using the message sequence number and gap data.

48. (Previously presented) The method of claim 47 in which validating further comprises discarding duplicate messages.

49. (Previously presented) The method of claim 48 in which validating further comprises tracking discarded duplicate messages.

50. (Previously presented) The method of claim 44 in which publishing comprises a private network.

51. (Previously presented) The method of claim 47 in which publishing further comprises updating the message sequence number.

52. (Previously presented) The method of claim 44 in which the market event object comprises:

- a time stamp field;
- a message time field;
- a market session data field;
- a line field;
- a feed field;
- a feed sequence number field;
- a message type field; and
- an original identification field.

53. (Currently amended) A computer system comprising:

- a processor; and

a memory, the memory comprising:
a receiver object for receiving a message from one of a plurality of feed lines;
a timing object for attaching timing data to the received message, the timing data including a time extracted from the received message, a stamp indicating a receipt time at the receiver object and other data;
a translator object to translate the received message into a market event object;
a queue object for receiving the market event object;
a validation object for validating the market event object entry; and
a sender object to send the validated market event object entry to a plurality of alert engines.

54. (Previously presented) The system of claim 53 in which the other data comprises a message delta obtained by comparing the time extracted from the received message with times of previously received messages from the one of the plurality of feed lines.

55. (Previously presented) An article comprising a machine-readable medium storing instructions operable to cause one or more machines to perform operations comprising:

receiving a message in a receiver object from one of a plurality of feed lines;
attaching timing data from a timing object to the received message, the timing data including a time extracted from the received message, a stamp indicating a receipt time at the receiver object and other data;
activating a translator object to translate the received message into a market event object;
assigning the market event object to an entry in a queue object;
validating the market event object entry; and
publishing the validated market event object entry in a sender object to a plurality of alert engines.

56. (Previously presented) The article of claim 55 in which the other data comprises a message delta obtained by comparing the time extracted from the received message with times of previously received messages from the one of the plurality of feed lines.

57. (Previously presented) The article of claim 55 in which assigning further comprises registering a message sequence number in an associated sequence state object, the associated sequence state object recording message order and gap data for the one of the plurality of feed lines.

58. (Previously presented) The article of claim 57 in which validating comprises determining whether the market event object entry is valid using the message sequence number and gap data.

59. (Previously presented) The article of claim 58 in which validating further comprises discarding duplicate messages.

60. (Previously presented) The article of claim 59 in which validating further comprises tracking discarded duplicate messages.

61. (Previously presented) The article of claim 55 in which publishing comprises a private network.

62. (Previously presented) The article of claim 58 in which publishing further comprises updating the message sequence number.

63. (Previously presented) The article of claim 55 in which the market event object comprises:
a time stamp field;
a message time field;
a market session data field;
